Combinatorial Optimization
Lab 447 Environment Check
Practical Test Preparation

Industrial Informatics Department
Czech Technical University in Prague
`http://iid.ciirc.cvut.cz/`

Lab 447 has been prepared for the upcoming practical test. Please follow the instructions below to verify your workstation setup *before* the exam begins.

1. System Startup and Login

1. Turn on your workstation.
2. When the boot menu appears, select the operating system `gurobi`.
3. Log in with the following credentials:
   - Username: `guest`
   - Password: `xxx`

2. Python Environment and Gurobi Verification

1. Open a terminal and run:

```
~/gurobi.sh
```

2. Launch **Development** → **VSCodium**.
3. Switch the Python interpreter to the virtual environment in your home folder: `~/.env/bin/python` (enable *show hidden files* to see `.env`).
4. **Important:**
   - Internet access is disabled. You will **not** be able to install packages or dependencies later.
   - Do not delete or overwrite the `.env` directory under any circumstances.
5. Create a test script with the snippet below and run it to verify the Gurobi installation and the academic license:

```
import gurobipy as gp

# Initialize model and check license limits
m = gp.Model("test_license")
x = m.addVars(5000, name="x")
m.update()

print("License check passed successfully!")
```

3. Accessing BRUTE

1. There is currently no desktop or browser bookmark for BRUTE.
2. Open the **wiki** shortcut in your browser.
3. Follow the BRUTE link in the upper-left corner of the wiki page.
4. Log in with your standard CTU username and password. Single Sign-On (SSO) is unavailable in this environment and password reset services cannot be reached, so make sure you remember your credentials.

If any step fails (license errors, missing interpreter, login failure, ...), notify the instructor immediately.
